Document-2:
Track B Capstone Phase 1 — Ideation & Infrastructure

Project Phase: Kick-off & Tool Setup

Deadline: Sunday, March 15, 2026 at 11:59 PM

Instructor/Reviewer: Elias Jarso (`eliasjarso@hu.edu.et`)

To all MAD Students,

Welcome to Phase 1 of your Group Capstone Project. The goal of this initial phase is **not** to write a single line of Android code.

The goal is to lay a professional foundation for your project, just as you would in a real software development company. We are focusing entirely on Planning, Process, and Design. By setting up your industry-standard tools correctly now, the development phase will be smoother, more organized, and highly efficient.

You are being graded on the quality of your planning, the clarity of your vision to solve a local Ethiopian problem, and your ability to correctly configure `GitHub`, `Figma`, and `Jira`.

PART 1

The Project Proposal (The "Concept Note")

This is the central document that defines your project. It should be a clear, concise, and compelling overview of the problem you are solving and the app you plan to build.

Format: A single PDF document named `Project_Proposal.pdf`.

Required Sections:

1. **App Name & Tagline:**
   - **App Name:** A creative and memorable name for your application.
   - **Tagline:** A single, powerful sentence that describes the core value of your app (e.g., *"Digital Iqub: Securing community savings, transparently."*).
2. **Problem Statement:** Clearly define the real-world local problem you are addressing. Who is affected? Why is it a problem? Be specific.
3. **Brief User Persona:** Describe your ideal target user in 2-3 sentences. (e.g., *"Our user is Dawit, a 28-year-old merchant in Merkato who struggles to keep track of his physical Iqub contributions and payouts."*)
4. **Proposed Solution:** Describe how your mobile application will solve the problem. Explain the core concept and how it benefits your target user.
5. **Core Features (Minimum Viable Product - MVP):** This is the most important section. List the 3 to 5 essential features your app **must** have to be a useful, working first version. Be ruthless in cutting non-essential features. Use a bulleted list. (Example: User Login, Create an Iqub Group, Record a Contribution, Dashboard of Payouts).

6. **Team Members & The "Everyone Codes" Roles:** List the full names of all ~5 group members. As per the Master Guide, there are **no non-coding roles**. You must assign each member one of the following domains:
   - UI/UX Implementation Lead
   - Database & State Lead
   - Core Logic & Services Lead
   - Network & API Lead
   - DevOps & Testing Lead

PART 2

GitHub Repository Setup

Your `GitHub` repository is the central hub for your project's code and documentation.

Instructions:

1. **Create One Repository Per Group:** The name should be clear: `MAD-Project-[YourAppName]`.
2. **Invite Me as a Collaborator:** Go to `Settings > Collaborators > Add people`. Invite me using my GitHub username: `(use my email given above)`. This is mandatory for grading.
3. **Create a Professional README.md File:** This is the front page of your project. It must be well-formatted using Markdown and contain:
   - Your App Name and Tagline.
   - A brief Project Description (1-2 paragraphs from your proposal).
   - A list of Team Members and their assigned Technical Roles.
   - A direct, clickable link to your `Figma` design board.
   - A direct, clickable link to your `Jira` project board.
4. **Upload Your Project Proposal:** Create a folder named `/docs` in your repository. Place your `Project_Proposal.pdf` inside this folder.
5. **Add an Android .gitignore File:** Select the "Android" template when creating the repo. **Why?** This prevents you from committing unnecessary user-specific files (like heavy `Gradle` build files and local IDE settings) that will break your teammates' computers when they pull the code.

PART 3

Figma UI/UX Design (The Visual Blueprint)

`Figma` is where your app's visual identity will take shape. For this deadline, I do **not** expect a pixel-perfect, high-fidelity colorful design. I expect a well-thought-out structural plan.

Instructions:

1. **Develop Low-Fidelity Wireframes:** A wireframe is a simple sketch of a screen. Use only boxes, lines, and placeholder text. Focus on layout, structure, and user flow, not colors or fonts. Create wireframes for your 3-5 core MVP screens.

2. **Create a User Flow:** On your `Figma` board, use arrows or the prototyping feature to connect your wireframes. Show how a user navigates from Login to the Dashboard to adding data.
3. **Share the Project:** Click the "Share" button, ensure the permissions are set to "Anyone with the link can view," and place this link in your `GitHub README.md`.

PART 4

Jira Project Management (The Work Plan)

`Jira` is how professional Agile teams track their work. Setting this up correctly demonstrates your ability to break a large project into manageable tasks.

Instructions:

1. **Create a Jira Project:** Choose a Scrum project template.
2. **Invite Me:** Invite me to the board using my email: **`eliasjarso@hu.edu.et`**.
3. **Populate the Backlog with Epics:** Take your 3-5 MVP Core Features and create one "Epic" for each in `Jira` (e.g., `Epic: User Authentication`).
4. **Break Down an Epic into User Stories:** Choose your most important Epic and break it down into smaller tasks (User Stories). Use the standard Agile format: *"As a [user], I want to [action], so that I can [goal]."*
   - **Example:** *"As a new user, I want to create an account with my phone number, so I can join an Iqub."*
5. **Plan Your First Sprint:** Create "Sprint 1: Project Setup & Design" (Duration: 1 week). Drag your foundational tasks (creating the PDF, making wireframes, setting up `GitHub`) from the Backlog into this Sprint and assign each task to the specific team member responsible for it.

SUBMISSION CHECKLIST

Phase 1 Submission Checklist

By Sunday night at 11:59 PM, **the DevOps/Project Lead must submit the public link to your GitHub Repository to the University LMS portal.** Everything else must be linked from that central repository.

- ☐ **GitHub:** Repo created, `eliasjarso@hu.edu.et` invited, `README.md` is fully populated with all links, `.gitignore` is present, and `/docs/Project_Proposal.pdf` is uploaded.
- ☐ **Figma:** Link in README works, contains 3-5 core low-fidelity wireframes, and shows a basic user flow.
- ☐ **Jira:** Link in README works, `eliasjarso@hu.edu.et` is invited, Backlog contains Epics, "Sprint 1" is active, and tasks are assigned to specific team members based on their roles.

The more MVPs and more pages in your document, the better!

Good luck. I am excited to see the impactful, culturally relevant ideas you bring to the table!
